Description

These devices are digitally controlled analog switches which utilize silicon gate CMOS technology to achieve operating speeds similar to LSTTL with the low power consumption of standard CMOS integrated circuits.

These analog multiplexers/demultiplexers control analog voltages that may vary across the voltage supply range (i.e. V$_{CC}$ to V$_{EE}$). They are bidirectional switches thus allowing any analog input to be used as an output and visa-versa. The switches have low "on" resistance and low "off" leakages. In addition, all three devices have an enable control which, when high, disables all switches to their "off" state.

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

3. All voltages referenced to GND unless otherwise specified.

4. θ_{JA} is measured with the component mounted on an evaluation PC board in free air.

5. In certain applications, the external load resistor current may include both V_{CC} and signal line components. To avoid drawing V_{CC} current when switch current flows into the transmission gate inputs, the voltage drop across the bidirectional switch must not exceed 0.6V (calculated from r_{ON} values shown in Electrical Specifications table). No V_{CC} current will flow through R_L if the switch current flows into terminal 3 on the HC/HCT4051; terminals 3 and 13 on the HC/HCT4052; terminals 4, 14 and 15 on the HC/HCT4053.

NOTES:

9. Adjust input voltage to obtain 0dBm at V_{OS} for $f_{IN} = 1MHz$.

10. V_{IS} is centered at $(V_{CC} - V_{EE})/2$.

11. Adjust input for 0dBm.

12. Not applicable for HC/HCT4051.
